

Welcome to

Gather

Using Ajax

(JANUARY - MARCH 2025)

In this project, We use Ajax
in login (normal) page.

File Viewer

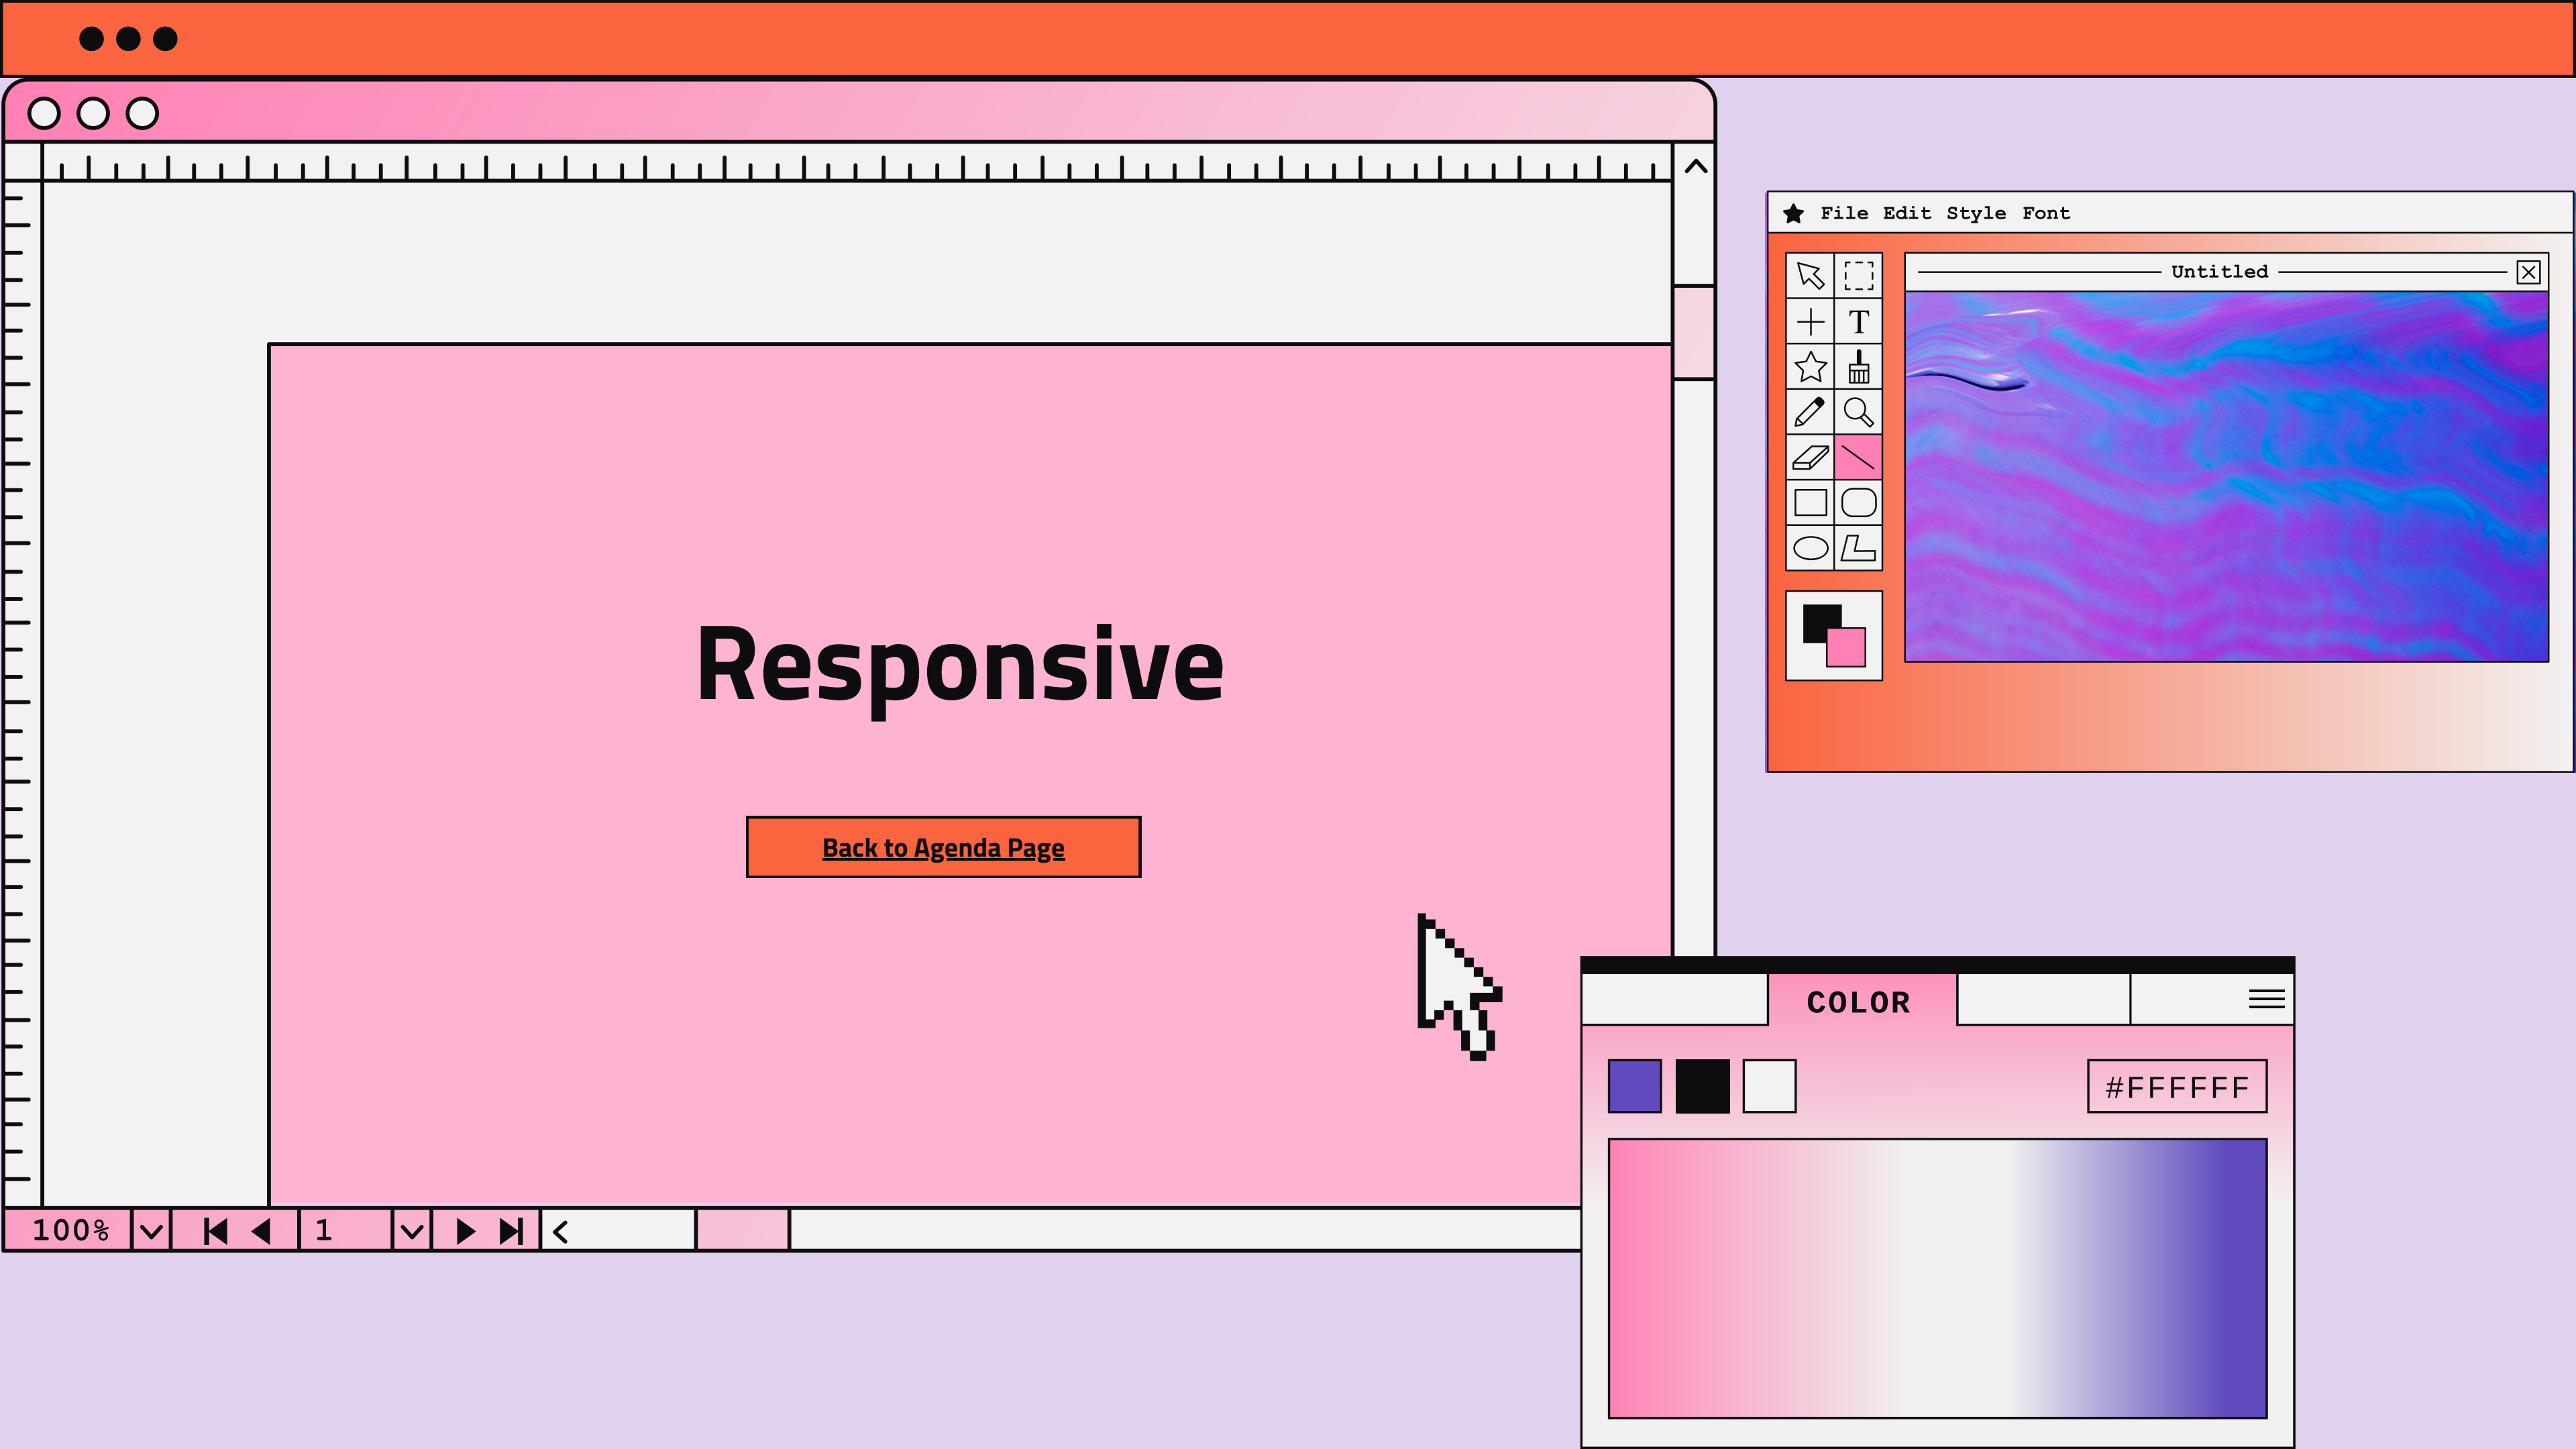

```
<script>
function loginClick() {

    let xhr = new XMLHttpRequest();
    xhr.open("POST", "/api/auth/login", true);
    xhr.setRequestHeader("Content-Type", "application/json");

    xhr.onreadystatechange = function () {
        if (xhr.readyState === 4) {
            if (xhr.status === 200) {
                let response = JSON.parse(xhr.responseText);
                if (response.status === "Login success") {
                    window.location.href = "/home";
                } else {
                    window.showToast(response.message || "Login failed", "error");
                }
            } else {
                let errorMessage = "Login failed";
                try {
                    let response = JSON.parse(xhr.responseText);
                    errorMessage = response.message || "An unexpected error occurred";
                } catch (e) {
                    errorMessage = xhr.responseText || "An unexpected error occurred";
                }
                window.showToast(errorMessage, "error");
            }
        }
    };

    let data = JSON.stringify({
        username: username,
        password: password
    });

    xhr.send(data);
}
```
